

#Regex Extract mail.id

```
import re
```

```
s = 'My name is Conrad@gmail.com, and blahblah@gmail.com is my email@in.in.'
```

```
domain = re.findall("[\w.]+@[ \w.]+\.[in]", s)
```

```
print(domain)
```

Otherwise, other alternative expressions would be:

```
[\w.]+@[ \w+\.(?!com)[a-z]{2,6}
```

or,

```
[\w.]+@[ \w+\.(?!com)[a-z]+
```

or,

```
[\w.]+@[ \w+\.(?!com)[a-z0-9]+
```

or with a looking ahead to space or end of the string,

```
[\w.]+@[ \w+\.(?!com)[a-z]{2,6}(?=\s|$)
```

depending on how your inputs may look like.

Demo 2

Another option would be to swipe every [A-Za-z0-9_ .] after the @ and exclude those with .com, and then looking ahead to space or end of string:

```
[\w.]+@(?:[\w.](?!\.com))*(?=\s|$)
```
